OFFICIAL RESEARCH AND DEVELOPMENT PROPOSAL

ChristEye

A Faith-Inspired Biohybrid Computing Initiative

Submitted by: We Develop Software LLC | **Missouri registration:** LC1064140
Representative: Bradley Gearon | **Date:** October 31, 2026
Submitted to: United States Congress and relevant federal research agencies

Purpose

We Develop Software LLC proposes an exploratory research program for **ChristEye**, a proposed affordable, customizable alternative to conventional artificial intelligence. The concept combines living human-derived neurons, electronic interfaces, spoken interaction, and optional personalization inspired by the teachings and values of Jesus Christ. ChristEye is a research concept, not an established product.

Proposed Technology

1. **Living-neuron computing.** Study ethically sourced, laboratory-grown human neurons as adaptive biological computing elements.
2. **Carbohydrate-based nourishment.** Evaluate glucose-containing culture media and other medically appropriate nutrient systems derived from carbohydrates; raw starch alone is not an established neuronal fuel.
3. **Speech and creativity.** Connect measured neural activity to software for speech, language, feedback, and creative tasks; evaluate whether the biological component offers a real benefit.
4. **Soul and spirit training.** Offer optional user-controlled faith, moral, emotional, and relational profiles grounded in love, compassion, forgiveness, and Christian teaching.
5. **Computer compatibility.** Pursue a laboratory module that interfaces with ordinary computers, followed by tests of practicality, cost, and accessibility.

Public Benefit and Evaluation

The goal is to explore expressive, resource-conscious, accessible computing. Performance, safety, total operating cost, energy use, reliability, creativity, and maintainability would be compared independently with conventional AI rather than asserted in advance.

Requested Federal Action

We request consideration of a modest, independently reviewed feasibility initiative involving qualified research partners, bioethics review, voluntary participation, appropriate donor consent, biosafety controls, and an initial laboratory demonstration. Any religious features would be strictly optional, with freedom of belief respected.

Founder's Vision

The founder envisions ChristEye as technology inspired by Christian faith that serves humanity through love, creativity, spiritual reflection, and care for life. These are statements of inspiration, not evidence that a device contains a divine presence or a human soul.

Respectfully submitted, Bradley Gearon | We Develop Software LLC
